

Forest MIRA

Forest rescoring in Joshua for MIRA training

Team Members

Matt Post (JHU)

Gideon Wenniger (Amsterdam)

Forest MIRA

Margin-infused relaxed algorithm

Crammer & Singer (2003, 2006)

Large scale discriminative tuner; maximizes model score difference between “hope” and “fear” translations

Chiang et al. (2008, 2009); Chiang (2012)

Batch implementation in Moses (`kbmira`)

Cherry & Foster (2012)

MIRA

Works by maximizing the margin between **hope** and **fear** items

hope items maximize

model score + λ BLEU score

fear items maximize

model score – λ BLEU score

Problem

Moses' `kbmira` extracts hope and fear items from the k-best list

Visualization

(Chiang, 2012)

The k-best list
is not
representative
of the model
space!

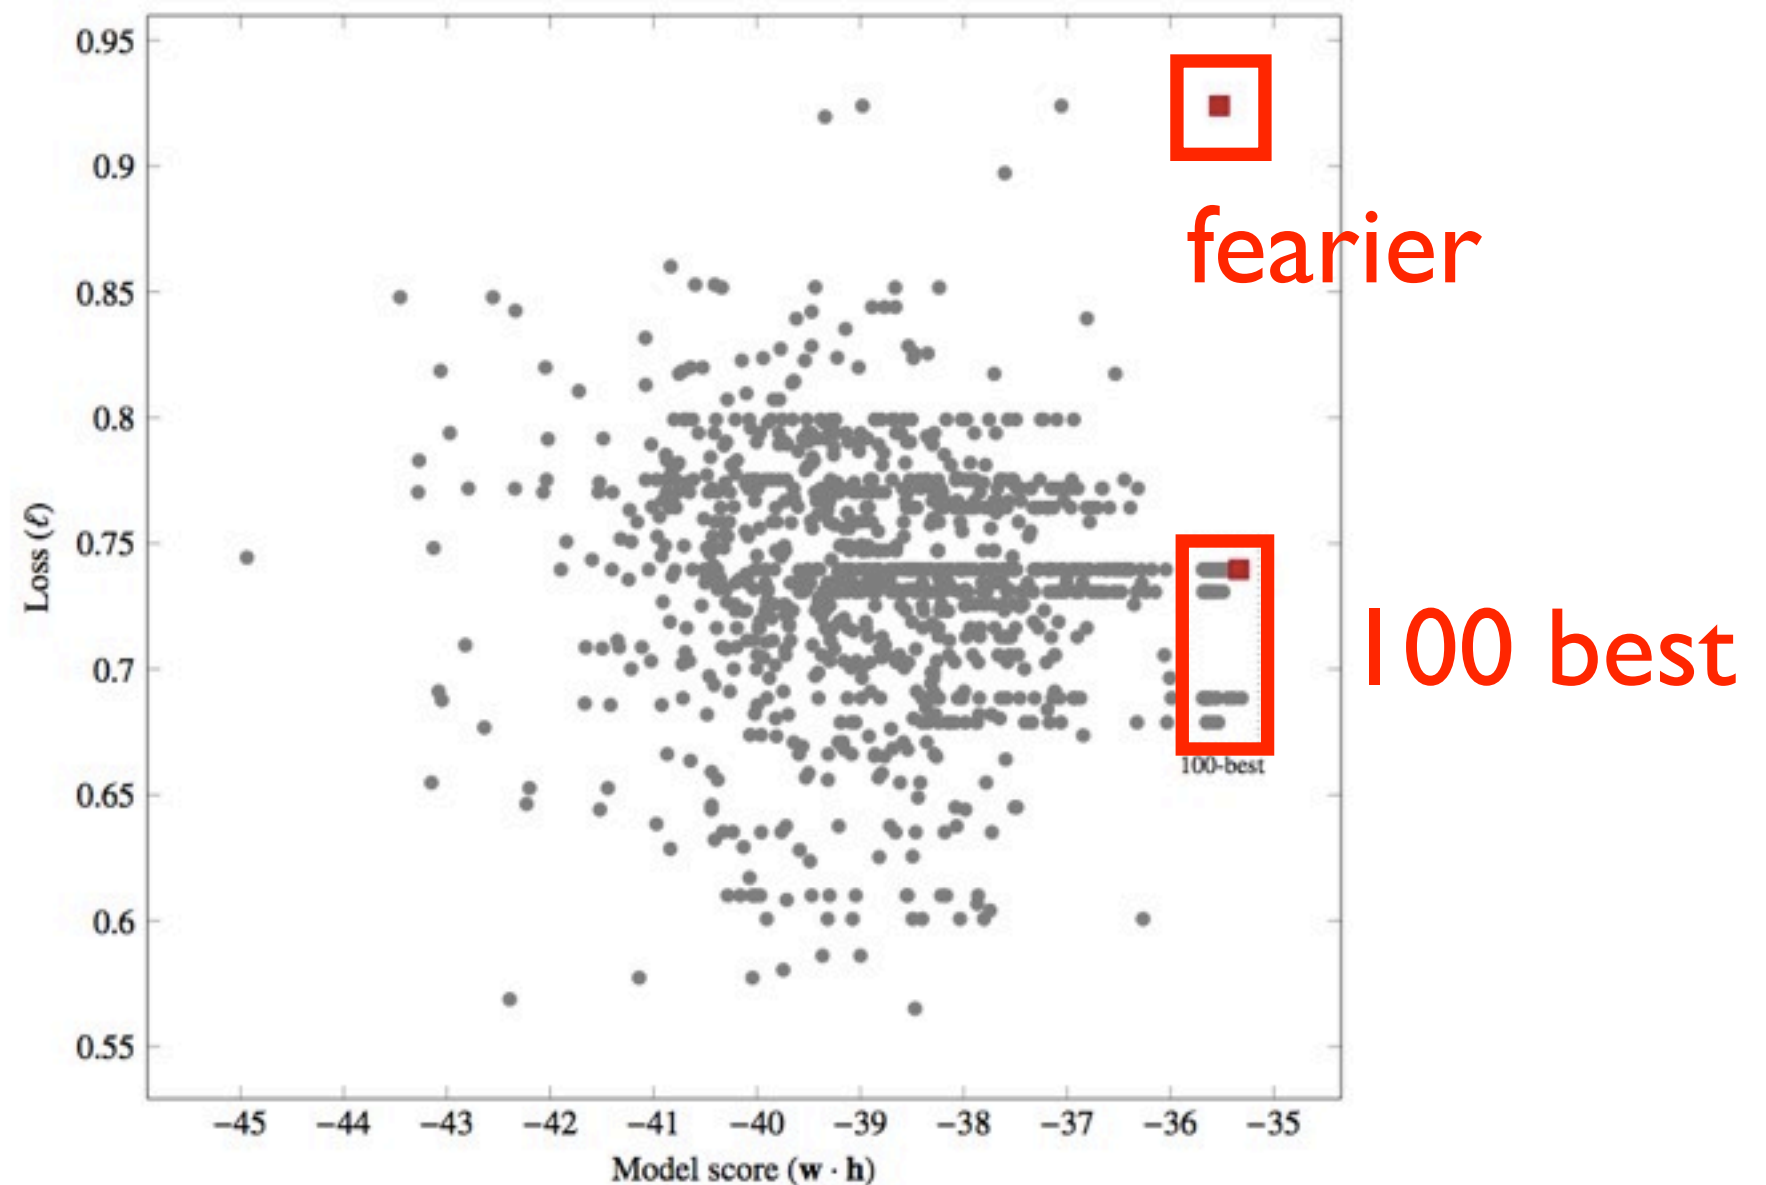

100 best

space!

Goal

Implement forest rescoring in Joshua
(Moses) for proper hope/fear updating in
Cherry & Foster's kbmira implementation

Sub-goals

- BLEU approximation that factors over the hypergraph
- Forest rescoring and extraction
- Write many-featured feature function

Factorizable BLEU

$$\text{BP} \times \exp \left(\sum_{n=1}^n \frac{1}{4} \log p_n \right)$$

Don't clip counts for each p_n

Scale reference length to proportion of input consumed

$$\lambda = (\text{span width}) / (\text{sentence length})$$

$$\text{BP} = \text{elen} / \lambda \cdot \text{reflen}$$

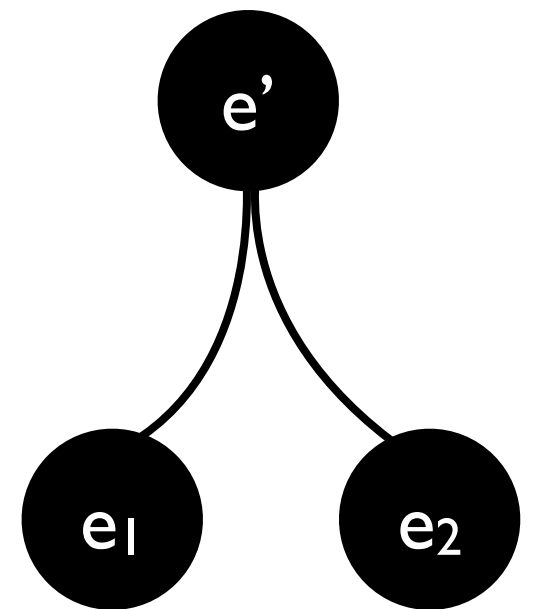

Scoring hyperedges

Decoder combines chart items by adding model scores (vectors of scores)

$$\text{score}(e') = \text{score}(e_1) + \text{score}(e_2)$$

Doesn't work with BLEU!

$$\text{BLEU}(e') \neq \text{BLEU}(e_1) + \text{BLEU}(e_2)$$

~BLEU

Instead, we have to store the sufficient statistics on each hyperedge

	n=1	n=2	n=3	n=4	len
<i>counts</i>	2	1	0	0	2

These we can sum together and then use to compute ~BLEU

Computing \sim BLEU

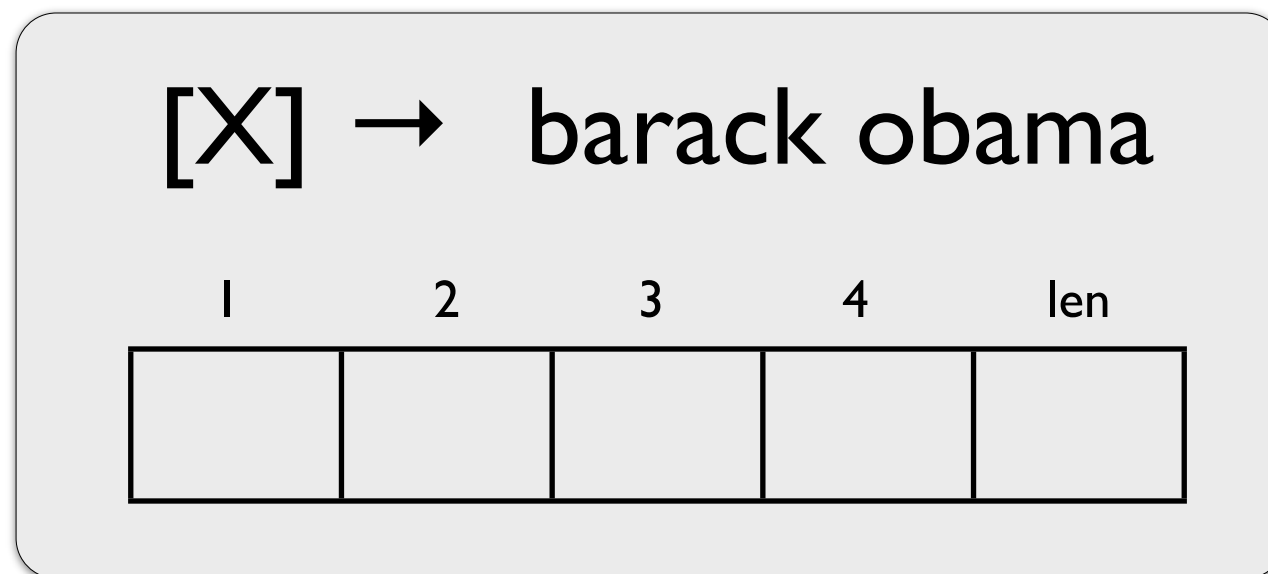

Terminal productions: accumulate all ngrams

1	2	3	4	len
4	3	2	1	4

combined

Rescoring

Once we have the BLEU scores on all edges, we apply standard k-best three times

- Extract the model best (per usual)
- Rescore with model + \sim BLEU (hope)
- Rescore with model – \sim BLEU (fear)

Experiments

German-English Europarl + Common Crawl

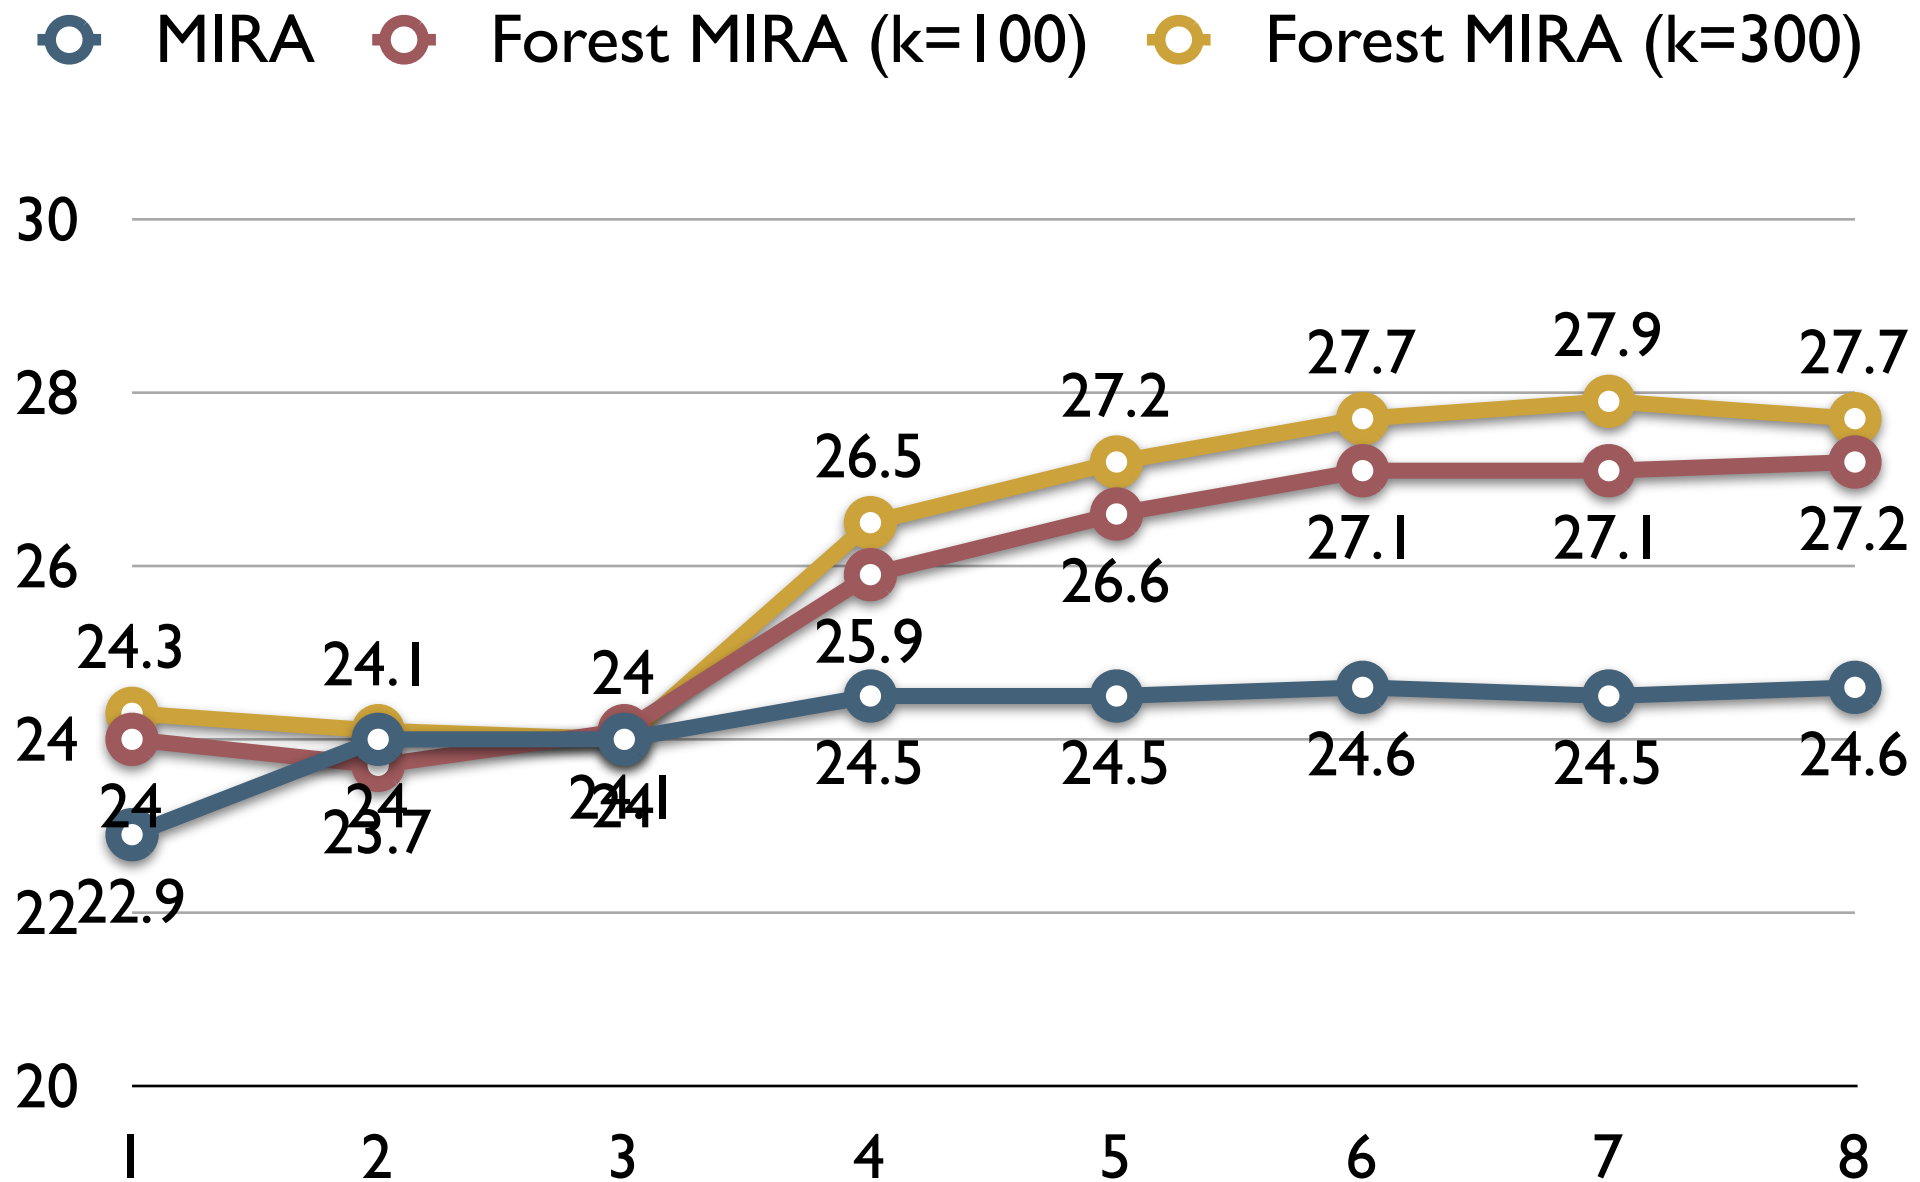

Tuning on newstest2010

Testing on newstest2012

Running MIRA for 8 iterations, test model
with best tuning score

10 features

Tuning

Test

Model	BLEU
MIRA	23.6
Forest MIRA (k=300)	23.1
Forest MIRA (k=100)	22.9

Problems

Can't use left-state minimization! We need the full state and don't want the complexity of state splitting

This means that we tune without left-state minimization, adding it back in for test, introducing a mismatch between models

Missing

Haven't included rolling / decaying BLEU
“pseudo corpus” stats

Haven't tested on large feature sets (where
we expect to see the most benefits, cf.
Cherry (2013))

Summary

Shows promise

Implementation is a little messy but not difficult
