## **Spring School**

#### Day 2: Word-based models and the EM algorithm

MT Marathon 13 May 2008

MT Marathon Spring School, Lecture 2 13 May 2008

#### Lexical translation

- How to translate a word → look up in dictionary
   Haus house, building, home, household, shell.
- Multiple translations
  - some more frequent than others
  - for instance: house, and building most common
  - special cases: Haus of a snail is its shell
- Note: During all the lectures, we will translate from a foreign language into English

#### **Collect statistics**

• Look at a parallel corpus (German text along with English translation)

`	_
Translation of Haus	Count
house	8,000
building	1,600
home	200
household	150
shell	50

MT Marathon Spring School, Lecture 2 13 May 2008

### Estimate translation probabilities

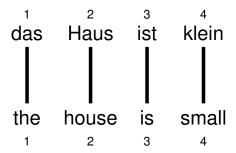

• Maximum likelihood estimation

$$p_f(e) = \begin{cases} 0.8 & \text{if } e = \textit{house}, \\ 0.16 & \text{if } e = \textit{building}, \\ 0.02 & \text{if } e = \textit{home}, \\ 0.015 & \text{if } e = \textit{household}, \\ 0.005 & \text{if } e = \textit{shell}. \end{cases}$$

### **Alignment**

• In a parallel text (or when we translate), we **align** words in one language with the words in the other

• Word *positions* are numbered 1–4

MT Marathon Spring School, Lecture 2 13 May 2008

### **Alignment function**

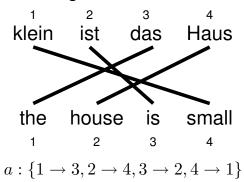

- Formalizing alignment with an alignment function
- ullet Mapping an English target word at position i to a German source word at position j with a function a:i o j
- Example

$$a: \{1 \to 1, 2 \to 2, 3 \to 3, 4 \to 4\}$$

### Reordering

• Words may be reordered during translation

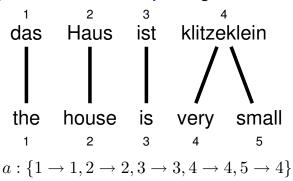

MT Marathon Spring School, Lecture 2 13 May 2008

### One-to-many translation

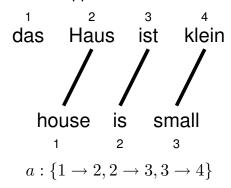

• A source word may translate into multiple target words

### **Dropping words**

- Words may be dropped when translated
  - The German article *das* is dropped

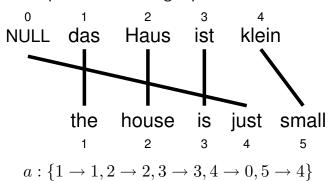

MT Marathon Spring School, Lecture 2 13 May 2008

### **Inserting words**

- Words may be added during translation
  - The English *just* does not have an equivalent in German
  - We still need to map it to something: special NULL token

#### IBM Model 1

- Generative model: break up translation process into smaller steps IBM Model 1 only uses lexical translation
- Translation probability

  - for a foreign sentence  $\mathbf{f}=(f_1,...,f_{l_f})$  of length  $l_f$  to an English sentence  $\mathbf{e}=(e_1,...,e_{l_e})$  of length  $l_e$
  - with an alignment of each English word  $\boldsymbol{e}_j$  to a foreign word  $f_i$  according to the alignment function  $a: j \rightarrow i$

$$p(\mathbf{e}, a|\mathbf{f}) = \frac{\epsilon}{(l_f + 1)^{l_e}} \prod_{j=1}^{l_e} t(e_j|f_{a(j)})$$

- parameter  $\epsilon$  is a normalization constant

MT Marathon Spring School, Lecture 2 13 May 2008

### **Example**

aas		
e	t(e f)	
the	0.7	
that	0.15	
which	0.075	
who	0.05	
this	0.025	

Haus	
e	t(e f)
house	0.8
building	0.16
home	0.02
household	0.015
shell	0.005

kleın		
e	t(e f)	
small	0.4	
little	0.4	
short	0.1	
minor	0.06	
petty	0.04	

$$\begin{split} p(e,a|f) &= \frac{\epsilon}{4^3} \times t(\text{the}|\text{das}) \times t(\text{house}|\text{Haus}) \times t(\text{is}|\text{ist}) \times t(\text{small}|\text{klein}) \\ &= \frac{\epsilon}{4^3} \times 0.7 \times 0.8 \times 0.8 \times 0.4 \\ &= 0.0028 \epsilon \end{split}$$

MT Marathon Spring School, Lecture 2 13 May 2008

Suro Suro

# Learning lexical translation models

- ullet We would like to  $\it estimate$  the lexical translation probabilities  $\it t(e|f)$  from a parallel corpus
- ... but we do not have the alignments
- Chicken and egg problem
  - if we had the alignments,
    - ightarrow we could estimate the *parameters* of our generative model
  - if we had the *parameters*,
    - $\rightarrow$  we could estimate the *alignments*

### **EM** algorithm

- Incomplete data
  - if we had *complete data*, would could estimate *model*
  - if we had model, we could fill in the gaps in the data
- Expectation Maximization (EM) in a nutshell
  - initialize model parameters (e.g. uniform)
  - assign probabilities to the missing data
  - estimate model parameters from completed data
  - iterate

MT Marathon Spring School, Lecture 2 13 May 2008

Euro Suro

# **EM** algorithm

... la maison ... la maison blue ... la fleur ...

... the house ... the blue house ... the flower ...

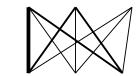

- Initial step: all alignments equally likely
- Model learns that, e.g., la is often aligned with the

### **EM** algorithm

la maison ... la maison blue ... la fleur ...

 $\dots$  the house  $\dots$  the blue house  $\dots$  the flower  $\dots$ 

- After one iteration
- Alignments, e.g., between *la* and *the* are more likely

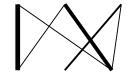

MT Marathon Spring School, Lecture 2 13 May 2008

### **EM** algorithm

... la maison ... la maison bleu ... la fleur ...

- After another iteration
- It becomes apparent that alignments, e.g., between *fleur* and *flower* are more likely (pigeon hole principle)

### **EM** algorithm

... la maison ... la maison bleu ... la fleur ...

... the house ... the blue house ... the flower ...

- Convergence
- Inherent hidden structure revealed by EM

MT Marathon Spring School, Lecture 2 13 May 2008

Suro Suro

### **EM** algorithm

... la maison ... la maison bleu ... la fleur ... la fle

p(maison|house) = 0.876p(bleu|blue) = 0.563

Parameter estimation from the aligned corpus

#### IBM Model 1 and EM

- EM Algorithm consists of two steps
- Expectation-Step: Apply model to the data
  - parts of the model are hidden (here: alignments)
  - using the model, assign probabilities to possible values
- Maximization-Step: Estimate model from data
  - take assign values as fact
  - collect counts (weighted by probabilities)
  - estimate model from counts
- Iterate these steps until convergence

MT Marathon Spring School, Lecture 2 13 May 2008

O LU Satrix

#### IBM Model 1 and EM

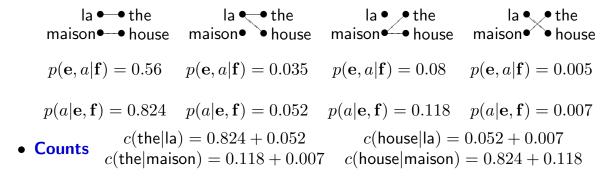

- We need to be able to compute:
  - Expectation-Step: probability of alignments
  - Maximization-Step: count collection

### IBM Model 1 and EM

• Probabilities  $p(\mathsf{the}|\mathsf{la}) = 0.7$   $p(\mathsf{house}|\mathsf{la}) = 0.05$   $p(\mathsf{the}|\mathsf{maison}) = 0.1$   $p(\mathsf{house}|\mathsf{maison}) = 0.8$ 

#### Alignments

MT Marathon Spring School, Lecture 2 13 May 2008

### IBM Model 1 and EM: Expectation Step

- We need to compute  $p(a|\mathbf{e},\mathbf{f})$
- Applying the *chain rule*:

$$p(a|\mathbf{e}, \mathbf{f}) = \frac{p(\mathbf{e}, a|\mathbf{f})}{p(\mathbf{e}|\mathbf{f})}$$

• We already have the formula for  $p(\mathbf{e}, \mathbf{a}|\mathbf{f})$  (definition of Model 1)

### IBM Model 1 and EM: Expectation Step

• We need to compute  $p(\mathbf{e}|\mathbf{f})$ 

$$p(\mathbf{e}|\mathbf{f}) = \sum_{a} p(\mathbf{e}, a|\mathbf{f})$$

$$= \sum_{a(1)=0}^{l_f} \dots \sum_{a(l_e)=0}^{l_f} p(\mathbf{e}, a|\mathbf{f})$$

$$= \sum_{a(1)=0}^{l_f} \dots \sum_{a(l_e)=0}^{l_f} \frac{\epsilon}{(l_f + 1)^{l_e}} \prod_{j=1}^{l_e} t(e_j|f_{a(j)})$$

MT Marathon Spring School, Lecture 2 13 May 2008

### IBM Model 1 and EM: Expectation Step

$$p(\mathbf{e}|\mathbf{f}) = \sum_{a(1)=0}^{l_f} \dots \sum_{a(l_e)=0}^{l_f} \frac{\epsilon}{(l_f+1)^{l_e}} \prod_{j=1}^{l_e} t(e_j|f_{a(j)})$$

$$= \frac{\epsilon}{(l_f+1)^{l_e}} \sum_{a(1)=0}^{l_f} \dots \sum_{a(l_e)=0}^{l_f} \prod_{j=1}^{l_e} t(e_j|f_{a(j)})$$

$$= \frac{\epsilon}{(l_f+1)^{l_e}} \prod_{j=1}^{l_e} \sum_{i=0}^{l_f} t(e_j|f_i)$$

- Note the trick in the last line
  - removes the need for an exponential number of products
  - → this makes IBM Model 1 estimation tractable

#### The trick

(case 
$$l_e = l_f = 2$$
)

$$\begin{split} \sum_{a(1)=0}^{2} \sum_{a(2)=0}^{2} &= \frac{\epsilon}{3^{2}} \prod_{j=1}^{2} t(e_{j}|f_{a(j)}) = \\ &= t(e_{1}|f_{0}) \ t(e_{2}|f_{0}) + t(e_{1}|f_{0}) \ t(e_{2}|f_{1}) + t(e_{1}|f_{0}) \ t(e_{2}|f_{2}) + \\ &+ t(e_{1}|f_{1}) \ t(e_{2}|f_{0}) + t(e_{1}|f_{1}) \ t(e_{2}|f_{1}) + t(e_{1}|f_{1}) \ t(e_{2}|f_{2}) + \\ &+ t(e_{1}|f_{2}) \ t(e_{2}|f_{0}) + t(e_{1}|f_{2}) \ t(e_{2}|f_{1}) + t(e_{1}|f_{2}) \ t(e_{2}|f_{2}) = \\ &= t(e_{1}|f_{0}) \ (t(e_{2}|f_{0}) + t(e_{2}|f_{1}) + t(e_{2}|f_{2})) + \\ &+ t(e_{1}|f_{1}) \ (t(e_{2}|f_{1}) + t(e_{2}|f_{1}) + t(e_{2}|f_{2})) + \\ &+ t(e_{1}|f_{2}) \ (t(e_{2}|f_{2}) + t(e_{2}|f_{1}) + t(e_{2}|f_{2})) = \\ &= (t(e_{1}|f_{0}) + t(e_{1}|f_{1}) + t(e_{1}|f_{2})) \ (t(e_{2}|f_{2}) + t(e_{2}|f_{1}) + t(e_{2}|f_{2})) \end{split}$$

MT Marathon Spring School, Lecture 2 13 May 2008

### IBM Model 1 and EM: Expectation Step

• Combine what we have:

$$\begin{split} p(\mathbf{a}|\mathbf{e},\mathbf{f}) &= p(\mathbf{e},\mathbf{a}|\mathbf{f})/p(\mathbf{e}|\mathbf{f}) \\ &= \frac{\frac{\epsilon}{(l_f+1)^{l_e}} \prod_{j=1}^{l_e} t(e_j|f_{a(j)})}{\frac{\epsilon}{(l_f+1)^{l_e}} \prod_{j=1}^{l_e} \sum_{i=0}^{l_f} t(e_j|f_i)} \\ &= \prod_{i=1}^{l_e} \frac{t(e_j|f_{a(j)})}{\sum_{i=0}^{l_f} t(e_i|f_i)} \end{split}$$

### IBM Model 1 and EM: Maximization Step

- Now we have to collect counts
- Evidence from a sentence pair e,f that word e is a translation of word f:

$$c(e|f; \mathbf{e}, \mathbf{f}) = \sum_{a} p(a|\mathbf{e}, \mathbf{f}) \sum_{i=1}^{l_e} \delta(e, e_j) \delta(f, f_{a(j)})$$

• With the same simplication as before:

$$c(e|f; \mathbf{e}, \mathbf{f}) = \frac{t(e|f)}{\sum_{i=0}^{l_f} t(e|f_i)} \sum_{j=1}^{l_e} \delta(e, e_j) \sum_{i=0}^{l_f} \delta(f, f_i)$$

MT Marathon Spring School, Lecture 2 13 May 2008

### IBM Model 1 and EM: Maximization Step

• After collecting these counts over a corpus, we can estimate the model:

$$t(e|f;\mathbf{e},\mathbf{f}) = \frac{\sum_{(\mathbf{e},\mathbf{f})} c(e|f;\mathbf{e},\mathbf{f}))}{\sum_{f} \sum_{(\mathbf{e},\mathbf{f})} c(e|f;\mathbf{e},\mathbf{f}))}$$

#### IBM Model 1 and EM: Pseudocode

```
initialize t(e|f) uniformly
do until convergence
 set count(e|f) to 0 for all e,f
 set total(f) to 0 for all f
 for all sentence pairs (e_s,f_s)
   for all words e in e_s
     total_s(e) = 0
     for all words f in f_s
       total_s(e) += t(e|f)
    for all words e in e_s
     for all words f in f_s
        count(e|f) += t(e|f) / total_s(e)
       total(f) += t(e|f) / total_s(e)
 for all f
   for all e
     t(e|f) = count(e|f) / total(f)
```

MT Marathon Spring School, Lecture 2 13 May 2008

Suro Suro

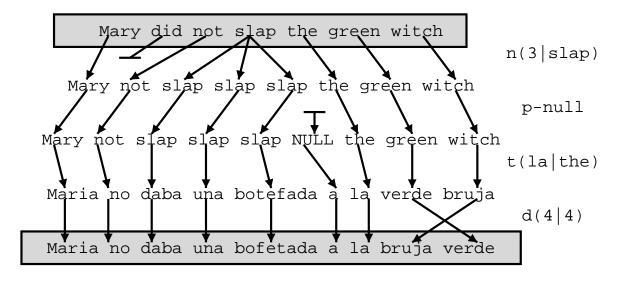

# **Higher IBM Models**

IBM Model 1	lexical translation
IBM Model 2	adds absolute reordering model
IBM Model 3	adds fertility model
IBM Model 4	relative reordering model
IBM Model 5	fixes deficiency

- Only IBM Model 1 has global maximum
  - training of a higher IBM model builds on previous model
- Computationally biggest change in Model 3
  - trick to simplify estimation does not work anymore
- → *exhaustive* count collection becomes computationally too expensive
  - sampling over high probability alignments is used instead

#### **IBM Model 4**

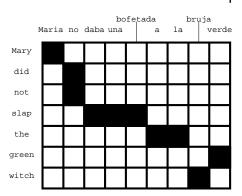

MT Marathon Spring School, Lecture 2 13 May 2008

Natri

# Word alignment

- Notion of word alignment valuable
- Shared task at NAACL 2003 and ACL 2005 workshops

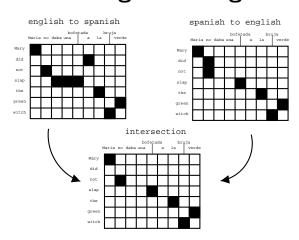

## Word alignment with IBM models

- IBM Models create a many-to-one mapping
  - words are aligned using an alignment function
  - a function may return the same value for different input (one-to-many mapping)
  - a function can not return multiple values for one input (no many-to-one mapping)
- But we need many-to-many mappings

MT Marathon Spring School, Lecture 2 13 May 2008

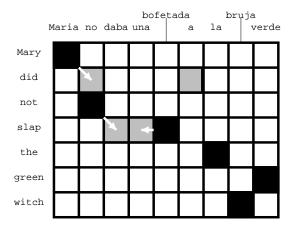

Suro

### Symmetrizing word alignments

• Intersection of GIZA++ bidirectional alignments

## Symmetrizing word alignments

• Grow additional alignment points [Och and Ney, CompLing2003]

MT Marathon Spring School, Lecture 2 13 May 2008

OTU

### **Growing heuristic**

```
GROW-DIAG-FINAL(e2f,f2e):
 neighboring = ((-1,0),(0,-1),(1,0),(0,1),(-1,-1),(-1,1),(1,-1),(1,1))
 alignment = intersect(e2f,f2e);
 GROW-DIAG(); FINAL(e2f); FINAL(f2e);
GROW-DIAG():
 iterate until no new points added
   for english word e = 0 \dots en
     for foreign word f = 0 ... fn
        if ( e aligned with f )
          for each neighboring point ( e-new, f-new ):
            if ( ( \mbox{e-new not aligned} and \mbox{f-new not aligned} ) and
                 ( e-new, f-new ) in union( e2f, f2e ) )
              add alignment point ( e-new, f-new )
FINAL(a):
 for english word e-new = 0 ... en
   for foreign word f-new = 0 ... fn
     if ( ( e-new not aligned or f-new not aligned ) and
           ( e-new, f-new ) in alignment a )
        add alignment point ( e-new, f-new )
```

### More Recent Work

- Symmetrization during training
  - symmetrize after each iteration of IBM Models
  - integrate symmetrization into models
- Discriminative training methods
  - supervised learning based on labeled data
  - semi-supervised learning with limited labeled data
- Better generative models
  - see talk by Alexander Fraser
